

The Localizer's hemispheric dome

How It Works

Maximum Isolation. Minimum Spillover.

The Localizer relies on the natural law of spherical surface reflection to create incomparable sound isolation. Our patented Virtual Audio Imaging (VAI) technology creates a truly isolated chamber of sound that maximizes audio isolation while minimizing audio spillover.

Superior Stereo Sound.

The Localizer is able to deliver superior stereo sound because the hemisphere acts as a lens, creating an audio "hologram" where the sound is actually heard as if the speakers were floating just outside the listener's ears. Until the development of the Localizer, this highly focused stereo listening experience was previously available only through headphones.
